## MPEG2 Video Over IP

Codec Model 2412 converts PAL or NTSC video into an MPEG-2 elementary stream using the UDP or RTP Ethernet protocol. In the decode mode it converts Ethernet streams into composite and S-video. The three-board PC/104 system is supplied with Linux and Apache web server for high reliability, fast response and easy configuration using a web browser. The 2412 is expandable to four video channels by adding model 512 codec boards. An 802.11b wireless option is available by adding model 340-11b. The Linux software includes multicasting and a network router. A fast stream player for Windows is available for viewing the 2412's data with less than one second of latency. Pan, zoom, and tilt signals are available from the unit's RS-232 ports. The single-channel 2412 is available now for \$1311. A four-channel 2412-4 cost \$2868 in small quantities.
